

Cortex Overview

Cortex Framework accelerates business outcomes through scenario-driven solutions, leveraging private data (e.g., Salesforce and SAP) and community/public data (e.g., Analytics Hub).

With Google Cloud services like BigQuery and Vertex AI, Cortex Framework provides reference architectures, deployment content, and integration services to solve specific business challenges faster.

Now, this capability is just a method call away

ABAP SDK can work with the Cortex Framework to offer bi-directional integration capabilities.

Enterprise Use Cases

Trigger data pipeline in BigQuery

Some SAP master data rarely changes, so replication merges only at scheduled times to save costs. Pub/Sub from ABAP events can trigger merges for critical data like the chart of accounts.

Side-by-side extensions

Customers migrating to SAP cloud offerings should avoid customizations. Instead, they should use cloud-native platforms and Pub/Sub patterns for business logic extensions.

Industry solutions

Cortex industry solutions require seamless SAP and Google Cloud integration. Pub/Sub enables non-invasive messaging, regardless of SAP version.

Business Workflows

SAP systems frequently trigger messages based on conditions, such as purchase requisitions, stock availability, or production orders.
